

## **Interleaving String Problem Documentation**

Given strings  $s_1$ ,  $s_2$ , and  $s_3$ , determine whether  $s_3$  is formed by an interleaving of  $s_1$  and  $s_2$ .

An interleaving of two strings  $s$  and  $t$  is a configuration where  $s$  and  $t$  are divided into  $n$  and  $m$  substrings respectively, such that:

- $s = s_1 + s_2 + \dots + s_n$
- $t = t_1 + t_2 + \dots + t_m$
- $|n - m| \leq 1$

The interleaving is  $s_1 + t_1 + s_2 + t_2 + s_3 + t_3 + \dots$  or  $t_1 + s_1 + t_2 + s_2 + t_3 + s_3 + \dots$

**Note:**  $a + b$  denotes the concatenation of strings  $a$  and  $b$ .

### **Example 1**

#### **Input:**

$s_1 = \text{"aabcc"}$

$s_2 = \text{"dbbca"}$

$s_3 = \text{"aadbcbcbac"}$

**Output:** true

#### **Explanation: One way to obtain $s_3$ is:**

- Split  $s_1$  into  $s_1 = \text{"aa"} + \text{"bc"} + \text{"c"}$
- Split  $s_2$  into  $s_2 = \text{"dbbc"} + \text{"a"}$

Interleaving the two splits, we get "aa" + "dbbc" + "bc" + "a" + "c" = "aadbcbcbac". Since s3 can be obtained by interleaving s1 and s2, the output is true.

## **Example 2**

### **Input:**

s1 = "aabcc"

s2 = "dbbca"

s3 = "aadbbaacc"

**Output:** false

**Explanation:** It is impossible to interleave s2 with any other string to obtain s3.

## **Example 3**

### **Input:**

s1 = ""

s2 = ""

s3 = ""

**Output:** true

## **Constraints**

- $0 \leq s1.length, s2.length \leq 100$
- $0 \leq s3.length \leq 200$
- $s1, s2,$  and  $s3$  consist of lowercase English letters.

## **Follow-up**

- Could you solve it using only  $O(s2.length)$  additional memory space?

## **Approach**

We use dynamic programming (DP) to solve this problem. The idea is to create a DP table where  $dp[i][j]$  indicates whether  $s3[0:i+j]$  can be formed by interleaving  $s1[0:i]$  and  $s2[0:j]$ .

## **Algorithm**

1. **Check Length Constraint:** If the length of  $s1$  plus the length of  $s2$  does not equal the length of  $s3$ , return False.
2. **Initialize DP Table:** Create a DP table  $dp$  with dimensions  $(len(s1) + 1) \times (len(s2) + 1)$  and initialize all values to False.
3. **Set Initial Condition:** Set  $dp[0][0]$  to True since an empty  $s3$  can be formed by interleaving two empty strings.
4. **Initialize First Row:** Populate the first row of the DP table where  $dp[i][0]$  indicates whether  $s3[0:i]$  can be formed by interleaving  $s1[0:i]$  and an empty  $s2$ .

5. **Initialize First Column:** Populate the first column of the DP table where  $dp[0][j]$  indicates whether  $s3[0:j]$  can be formed by interleaving an empty  $s1$  and  $s2[0:j]$ .
  
6. **Fill DP Table: Use the recursive relation to fill in the DP table:**
  - *$dp[i][j]$  is True if either:*
    - $dp[i-1][j]$  is True and  $s1[i-1]$  matches  $s3[i+j-1]$
    - $dp[i][j-1]$  is True and  $s2[j-1]$  matches  $s3[i+j-1]$
  
7. **Return Result:** The value at  $dp[\text{len}(s1)][\text{len}(s2)]$  will indicate whether  $s3$  can be formed by interleaving  $s1$  and  $s2$ .

### **Complexity Analysis**

- Time Complexity:  $O(\text{len}(s1) * \text{len}(s2))$
- Space Complexity:  $O(\text{len}(s1) * \text{len}(s2))$

The solution can be optimized to use  $O(\text{len}(s2))$  additional memory space by using a rolling array technique.
